

Kryptotel

KryptoMail

It's the mail-service that cannot be intercepted

INTRODUCTION

KryptoMail is a professional encrypted E-mail service that cannot be intercepted.

E-mails are normally transmitted as text files and are easily readable to anybody that has access to the servers or that can "sniff" the information that is exchanged through the Internet connection. There are many people that know how to easily do this through the Internet Service Providers.

The E-mail "logs" are kept by the Internet Service Providers for several years.

The use of interception methods for illegal Industrial Espionage but mostly for marketing competition purposes is extremely concerning not only in the business world but also in our private life.

KryptoMail encrypts every e-mail ([with Rsa 2048 bit](#)) so that only the sender and the recipient can read it, the transmission through the Internet is furthermore encrypted by using [TLS](#) protocol.

Furthermore our e-mail servers are encrypted with three encryption algorithms ([AES](#), [Serpent](#) e [Twofish](#).)

For extra safety NO e-mail logs are kept, therefore nobody can know the identity of the parties involved in the e-mail exchange.

Last but not least our e-mail servers are allocated in different countries that by law do not allow local authority to impose interception methods on Kryptotel.

Your Privacy is Our Mission!

PRE-REQUISITES

- Internet connections with adequate band speed for the size of files that want to be exchanged;
- Windows, Mac or Linux Operating Systems

HOW IT WORKS

By activating KryptoMail you will be given an easy to use, intuitive, simple and complete e-mail client, ([Thunderbird Portable version](#)) with the addition of all the encryption and decryption modules for e-mails.

- Encryption and Decryption can be set individually or automatically according to your preferences. You can use the same e-mail client and address to send non encrypted e-mails, for communication with recipients that do not have encrypted e-mails.
- E-mails can be signed by the sender in order to guarantee authenticity to the recipient.
- There are no limitations on e-mail size or amounts that can be sent and received through our service.
- The Encryption keys that are generated will remain on your computer and nobody but you and the recipient will be able to read the e-mails.
- The encryption system is open source therefore compatible with all services that use [Openpgp](#) to encrypt/sign e-mail messages.
- Other e-mail clients can be used on the same computer with no incompatibility issues.

SECURITY

Kryptotel has decided to operate with "open-source" encryption verified and tested by third parties and recognized as being safe by all verification studies.

The transmission of messages between your computer and Kryptotel's servers is encrypted through standard encryption protocols [TLS](#), the messages are encrypted before being transmitted with [RSA](#) protocol with 2048 bit keys.

The e-mail client used is not owned by Kryptotel, but developed by third parties and is enabled with the above mentioned encryption protocols for our clients total guarantee.

Our e-mail servers are furthermore [encrypted](#) with 3 different levels of [encryption](#), in order to guarantee impossibility of intrusion or tampering even by Kryptotel's personnel;

The servers DO NOT keep any logs of the e-mail exchanged; appointed third party technicians.

ADVANTAGES

- safe and private exchange of e-mails;
- safe and private exchange of every size files (no e-mail account size limitations);
- no trace of the e-mails exchanged;
- works all over the world as long as there is Internet connection.

COMPARISON

Kryptotel is the ONLY service in the world that guarantees total privacy of the e-mail messages due to the inviolable encryption protocols in use and because of the absolute ABSENCE of logs. All other services present on the market today state that they will allow local authority to intercept/tap you e-mail account if requested to.

First of all Kryptotel cannot do that because of the fact that the encryption keys are ONLY in the clients computer and second because of Kryptotel's Primary Company Mission. The right to private and safe communications is stated in the constitution of many countries (USA included). Kryptotel simply offers an instrument to guarantee everyone's rights.

ANONYMITY

It is not necessary to provide any personal data, unless a specific invoice is required. Only an email address where the configuration instructions and access password will be sent (best for your privacy that it is created for the occasion).

It is possible to receive invoices from another company not connectable with Kryptotel.

It is possible to pay in [various ways](#) even [anonymously](#) if desired.

PRICES

- The service only costs **3.95 Usd a month!** A small price for your privacy and security.

Unconditional guarantee "Satisfied or Reimbursed"
